Land Use Modelling for Environmental and Ecological Policy Assessment:

Sustainable Netherlands Study

in collaboration with:
Wageningen University & Research centre
WL | Delft Hydraulics
Arcadis

Netherlands Environmental
Assessment Agency

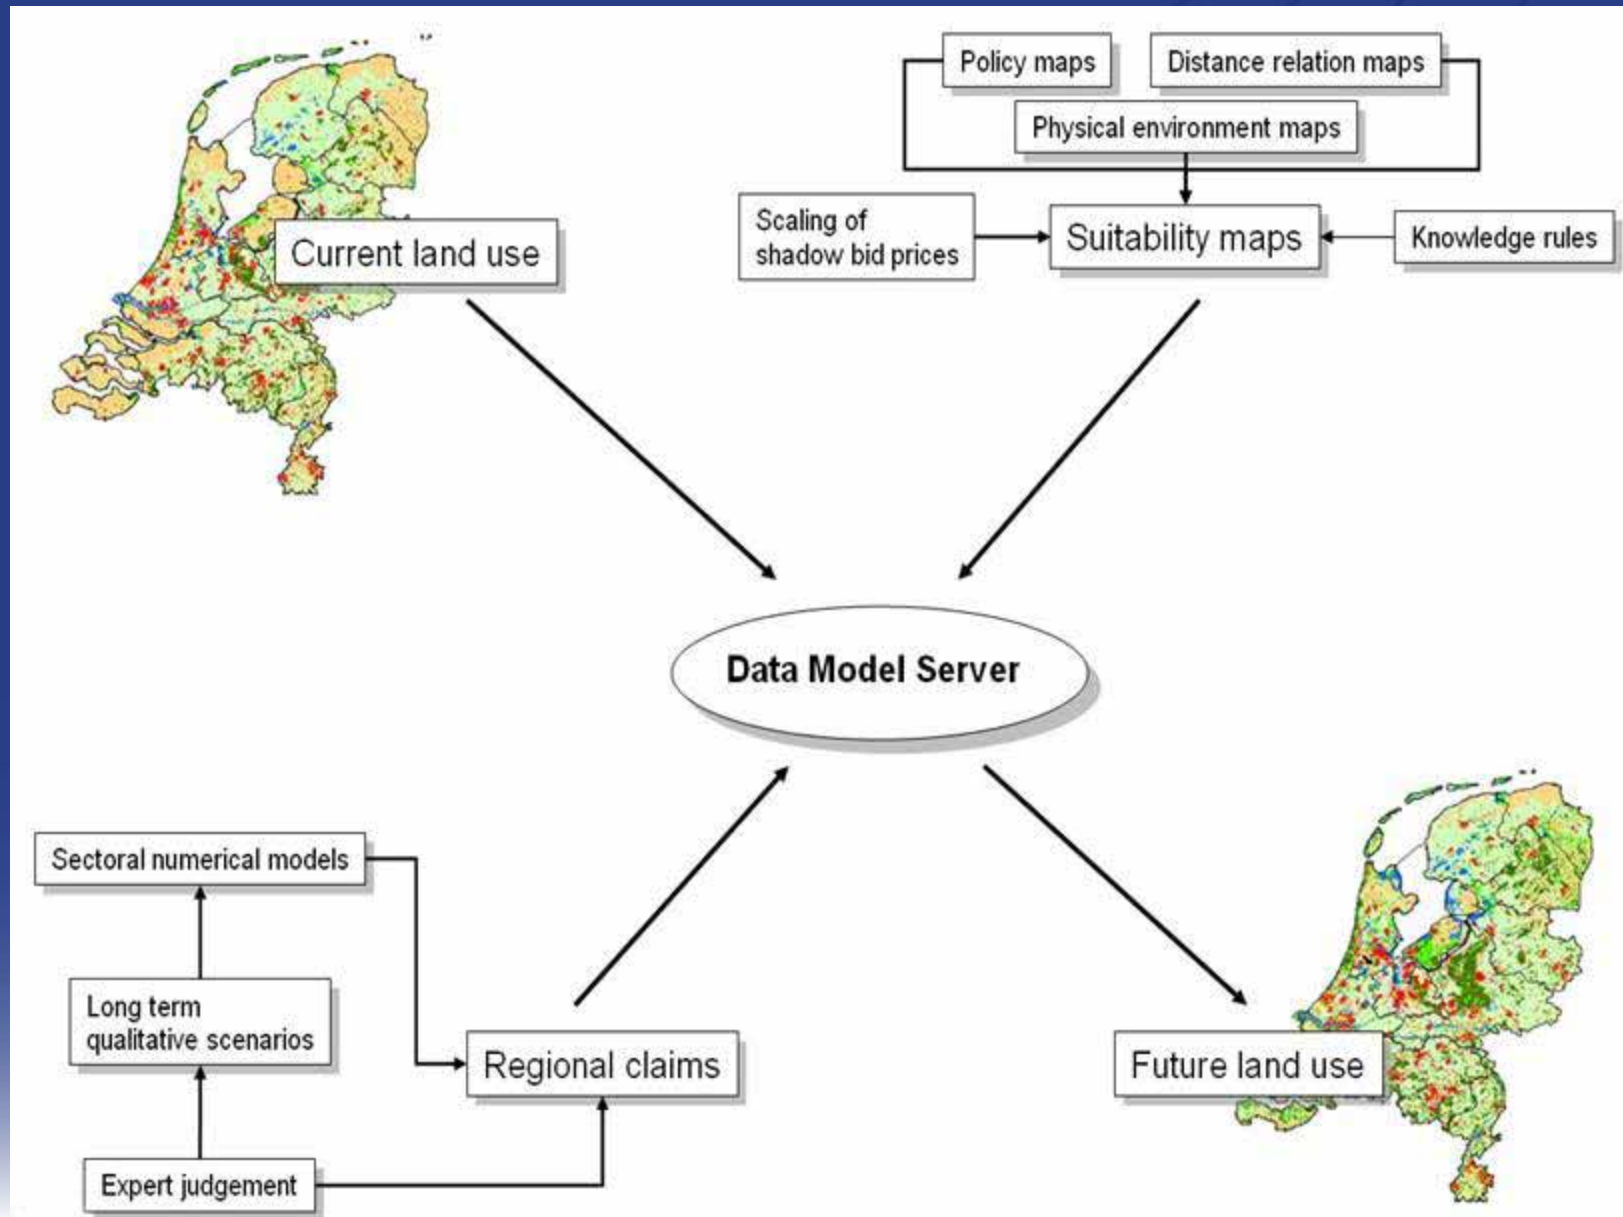

Research domains and sustainable development

Why interest in land use modelling?

- Many environmental and ecological problems related to developments in land use e.g.
 - habitat fragmentation
 - deterioration of landscapes
 - increased flooding risks
 - air quality and noise pollution
- Gain insight in spatial changes:
 - development multi-nomial logit based Land Use Scanner (1997) and CA-based Environment Explorer (1998)
- Applied for the Netherlands in
 - Environmental Outlooks
 - ex-ante evaluation National Spatial Policy Plan
 - Sustainability Outlook 1 and 2
- Intermediate step in model-chains

Structure Land Use Scanner

Example: Second sustainability outlook a request of the Dutch government

Sustainability Outlook published in 2 parts:

- “Sustainable Netherlands”
- “The Netherlands in a sustainable world”

Relevant questions from Upper and Lower House

- Motion Lemstra (Upper House): long-term strategic vision
- Motion Bochove/ Depla (Lower House): worst-case climate change

Framing actual policy discussions

Does the government wish to:

- ..consider and tackle challenges due to long term climate change and associated changes in the water system ?
- ..take international agreements (EU) seriously ?
- ..put effort into compact urbanization ?
- ..improve spatial conditions for (international) business and investment ?
- ..take people's wishes for high quality housing seriously ?
- ..invest in the cultural identity and quality of the Dutch landscape and living environment ?

Set up “Sustainable Netherlands”

Assessment Agency**

Trend scenario 2040

Land use 2040 according to Trend scenario

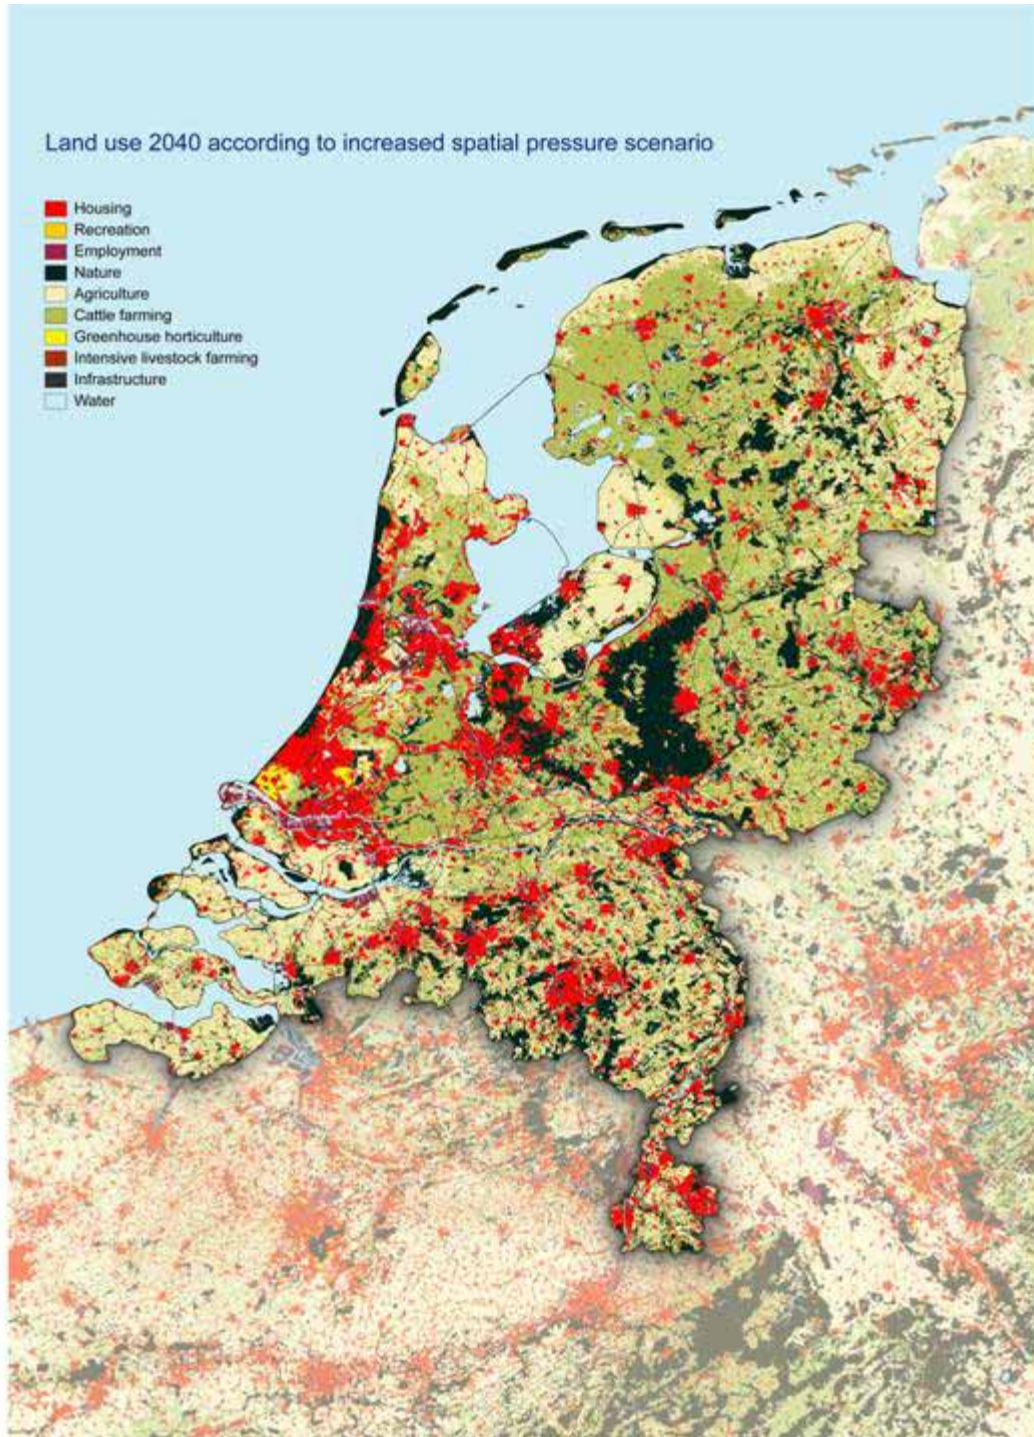

- Housing
- Recreation
- Employment
- Nature
- Agriculture
- Cattle farming
- Greenhouse horticulture
- Intensive livestock farming
- Infrastructure
- Water

- moderate spatial pressure
- stabilizing population
- moderate economical growth

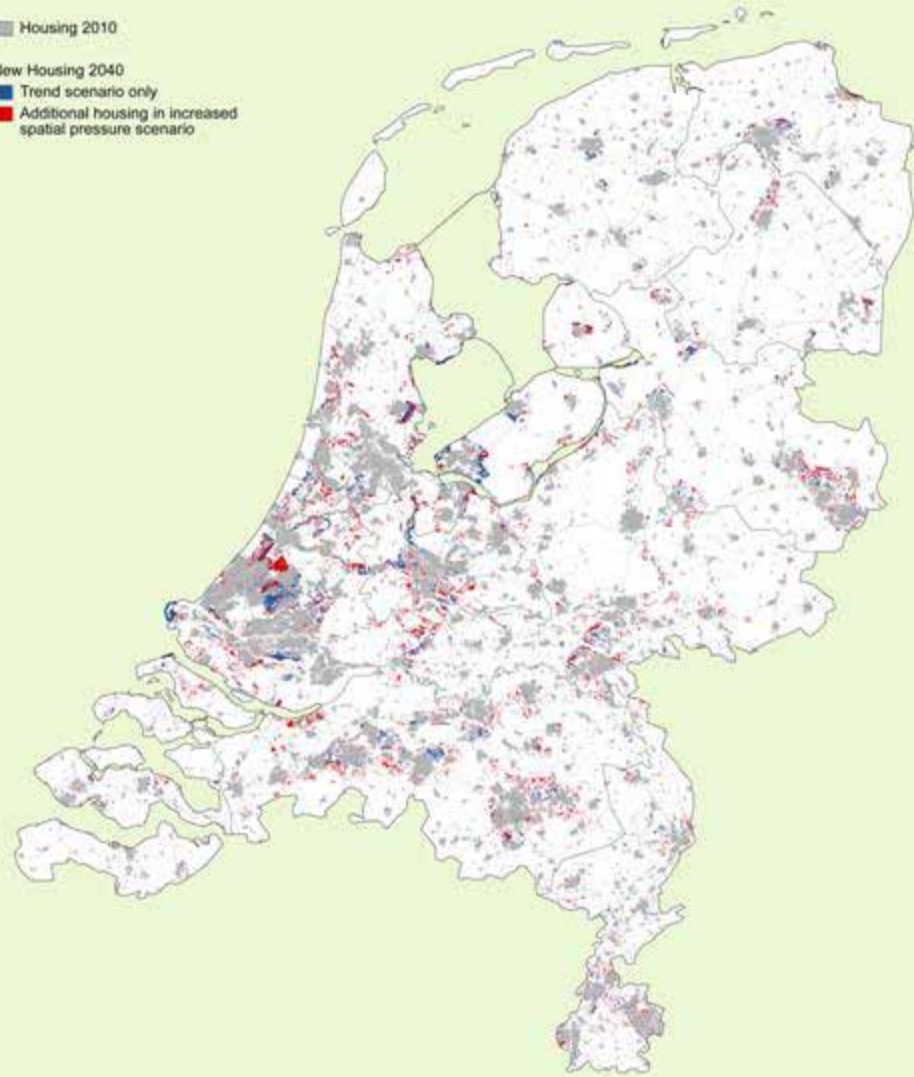

Trend scenario 2040

- high spatial pressure
- growing population
- high economical growth

Development housing 2010-2040 according to Trend scenario

- Housing 2010
- New Housing 2040
 - Trend scenario only
 - Additional housing in increased spatial pressure scenario

Trend scenario

Development 2010-2040

- moderate spatial pressure
- high spatial pressure

Effects Trend scenario

Indicator	Explanation	Development		Policy objective reached in Trend scenario	Explanation
		Trend scenario	Increased spatial pressure scenario		
Protection against flooding	Risk of damages and human casualties	Green	Green	Green	Overdue maintenance caught up by 2020, because of strengthening primary dams
Adaptation climate change	Space in river area	Yellow	Yellow	Green	Realisation Space for the River
Biodiversity	Biodiversity in nature areas	Green	Green	Red	Nature areas increase, but remain scattered. Biodiversity objectives are not met.
Accessibility	Congestion, accessibility workplace, financial accessibility benefits	Yellow	Yellow	Grey	Congestion main road network increases. Accessibility of workplace by car and public transport decreases.
Quality physical living environment	Greenery surrounding the city and noise pollution in living environment	Red	Red	Yellow	Noise pollution increases, while greenery surrounding the city decreases.
Spatious and green living	Space for personal wishes regarding living in green surroundings	Yellow	Red	Grey	No explicit policy objective
Conditions for establishment of international business	Congestion, risk perception, growth of Northern Randstad areas	Yellow	Red	Grey	No explicit policy objective
Quality of the landscape	Quality national landscapes, appreciation experience, recreational value	Red	Red	Red	Open national landscapes decrease
Spatial segregation	Spatial division of income groups	Yellow	Yellow	Grey	No explicit policy objective

Netherlands Environmental Assessment Agency

1. Climate change and safety against flooding

Problems:

- Current dikes do not meet current safety standards
- Safety standards are not in tune with damages and victims
- Climate change: rising sea levels and high water drainage of rivers

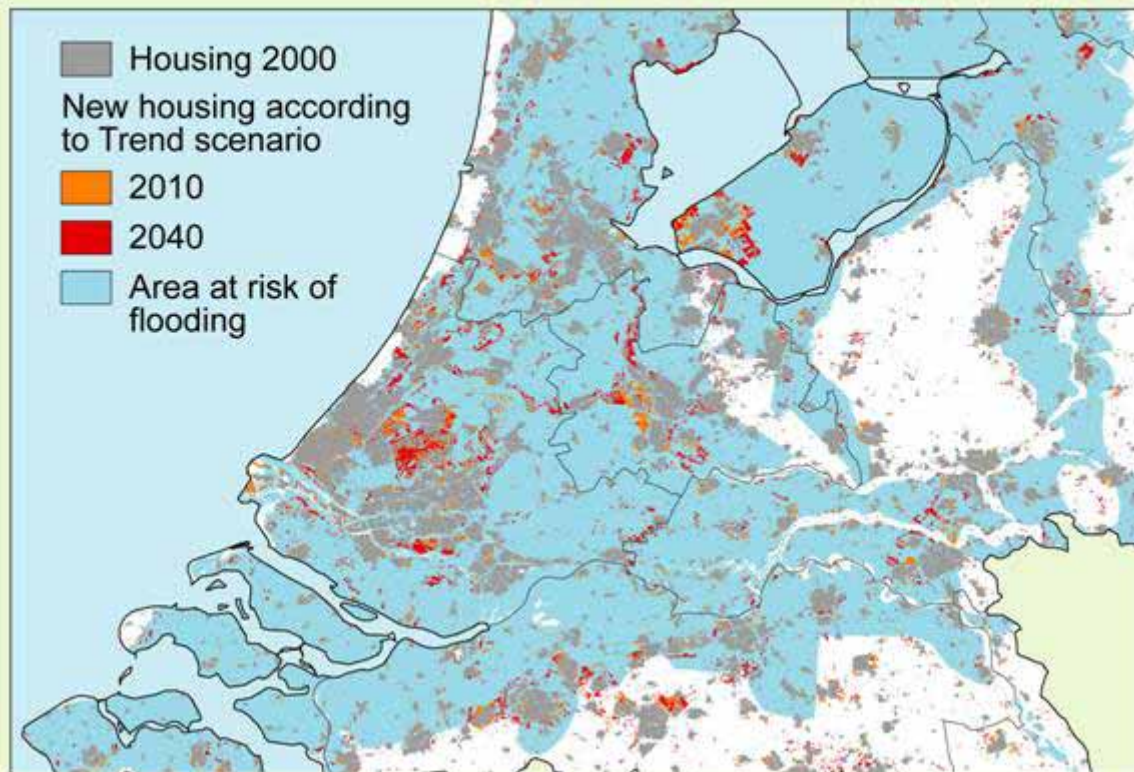

Solutions studied:

adjusting safety levels,
coastal development
withdrawal to high lying areas

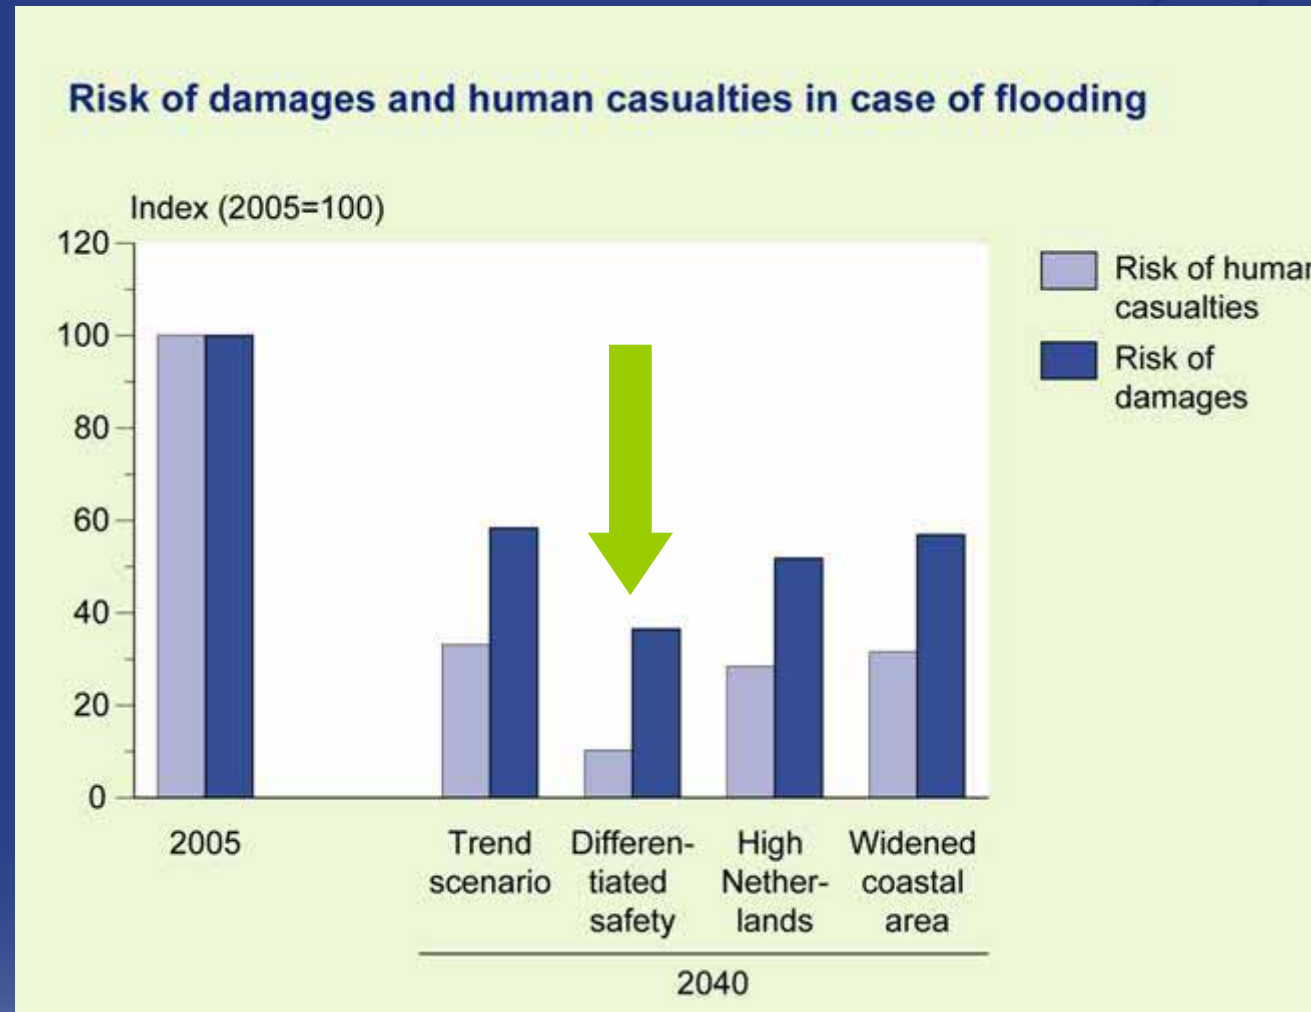

Urbanization 2000-2040: main developments in areas at risk of flooding

Housing in area at risk of flooding

Solutions studied: effects

Messages Climate and safety

- Adjust urbanization to differentiation of safety levels
- (coming centuries no need for withdrawal from low-lying Netherlands)
- Rising sea levels from 1.5 meters: large problems in delta areas → spatial reservation widened IJssel and IJsselmeer (incl. Markermeer and IJmeer) → coupling nature and compact urbanisation
- Coastal safety controlable; seaward extension not necessary
- NB: uncertainties storms and desintegration ice caps

2. Robust nature

Problems:

- Natura 2000 -species outside the Natura 2000 -areas
- Environmental quality Natura 2000
- Insufficient spatial coherence Natura 2000

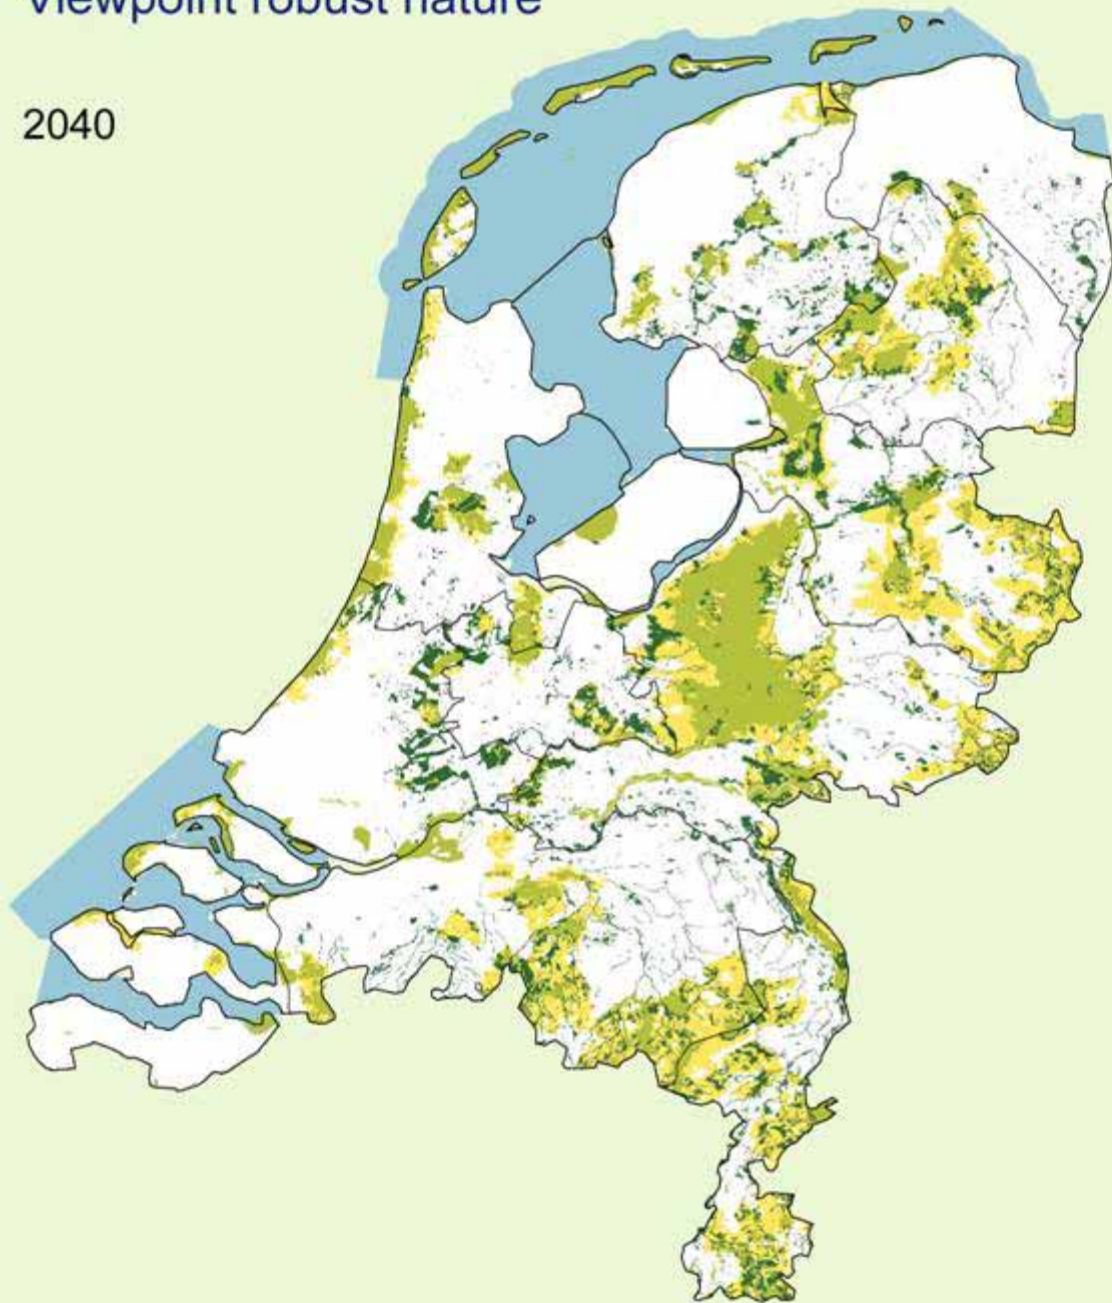

Solutions studied:

- Concentration nature development within and around Natura 2000
- Protection of catchment areas

Viewpoint robust nature

2040

Natura 2000
land

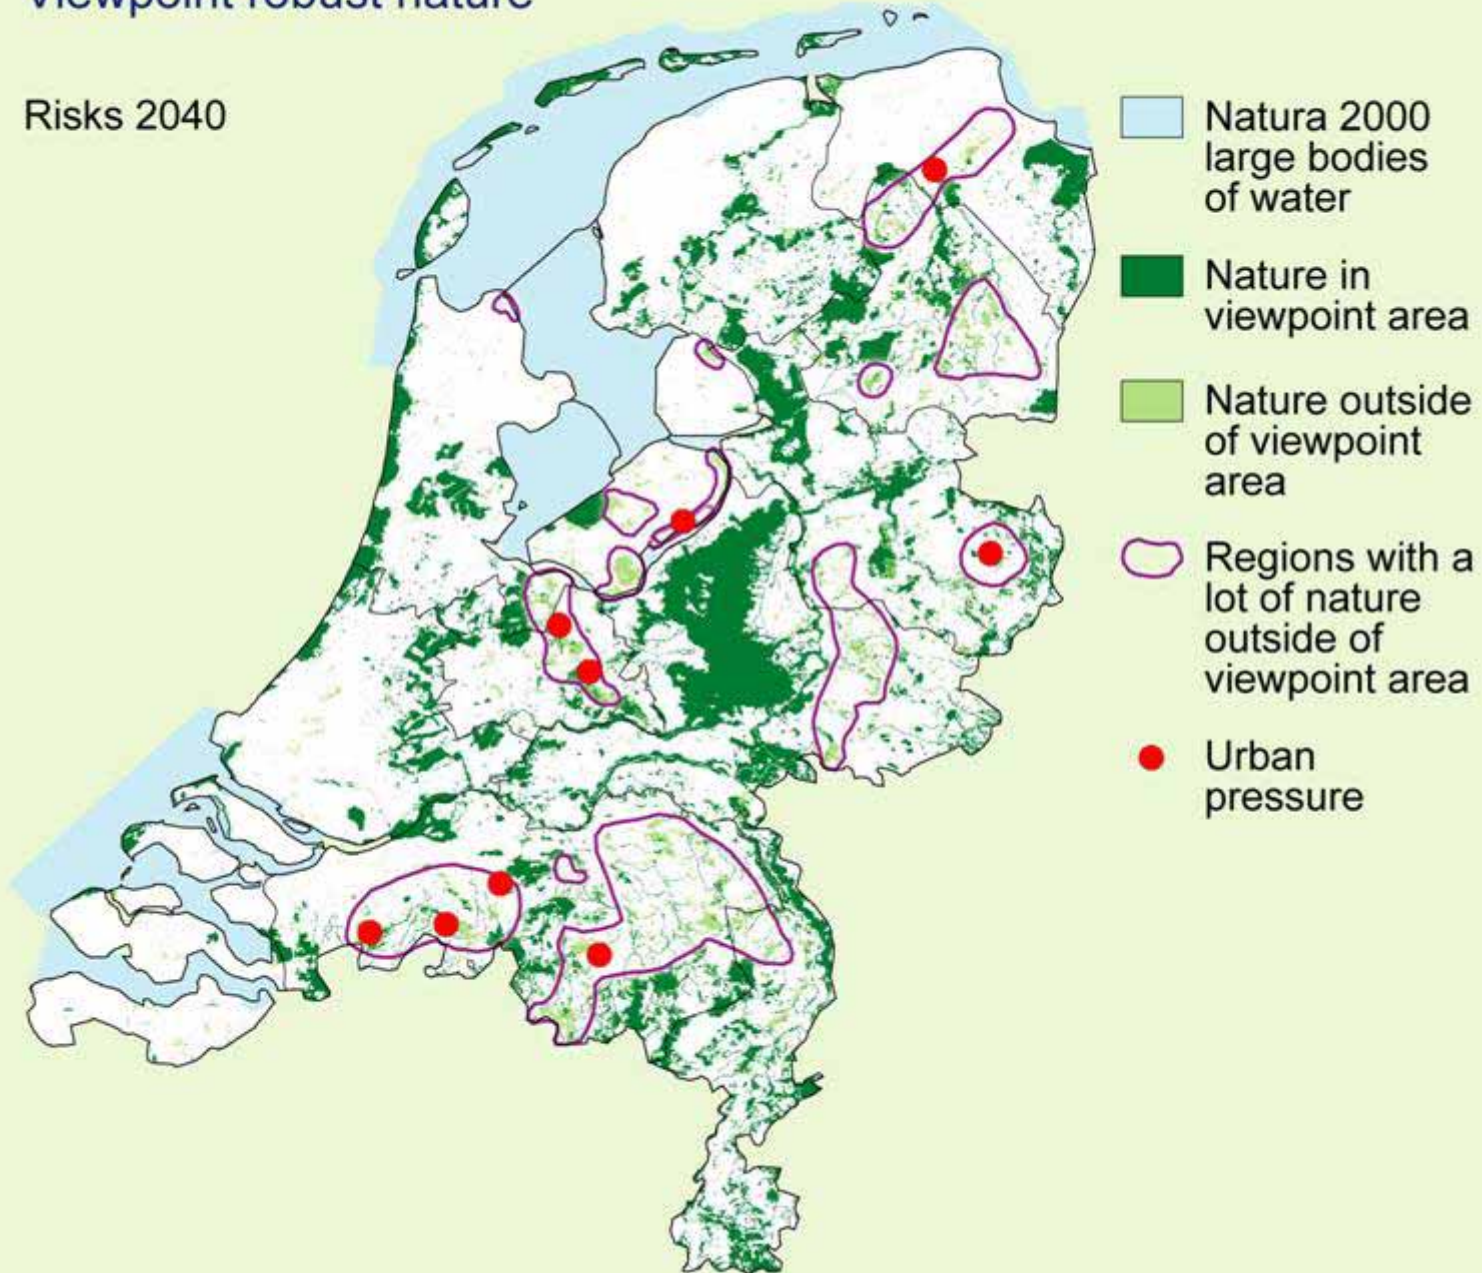

Expansion
nature

Catchment
areas

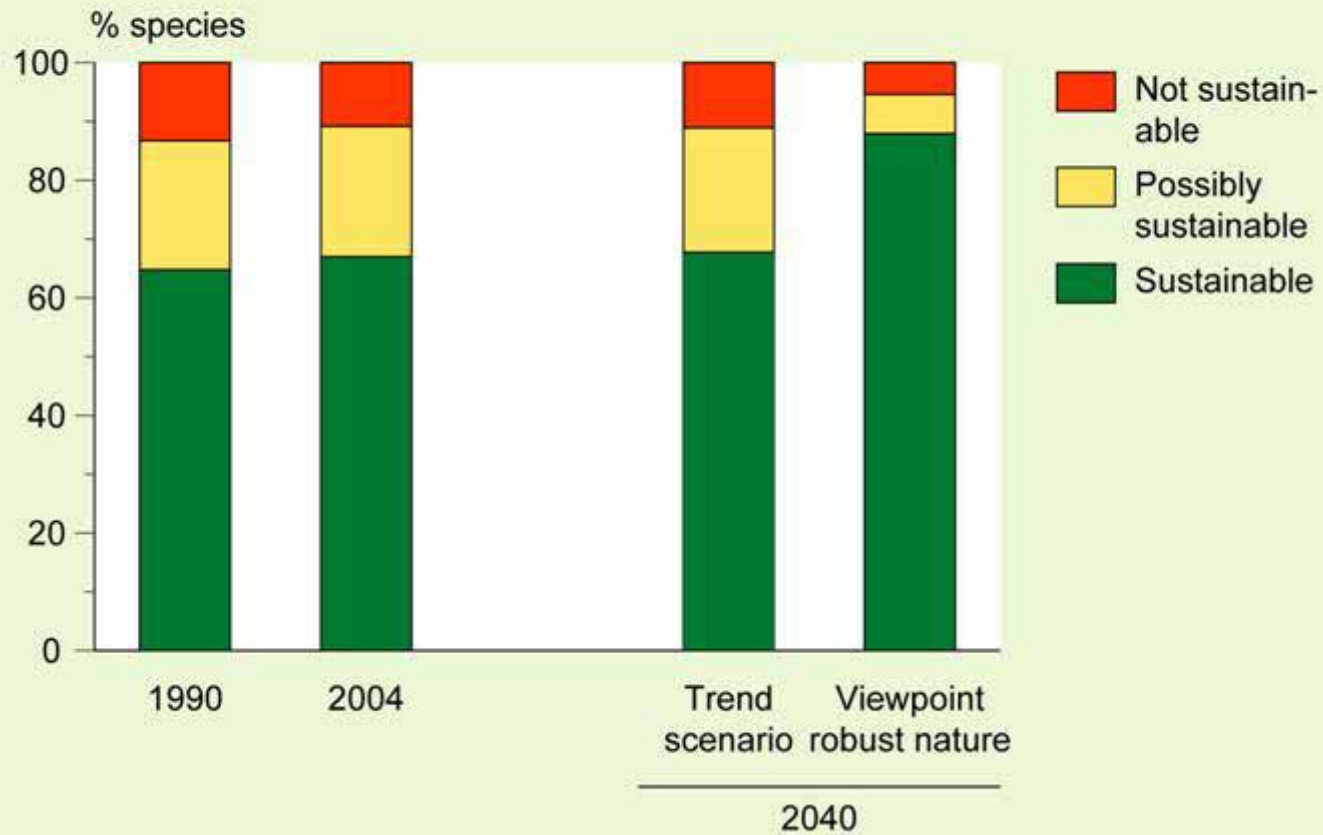

Natura 2000
large bodies
of water

Viewpoint robust nature

Risks 2040

Spatial conditions fauna species

Messages Robust nature

- Concentrating nature development in and around Natura-2000 areas improves long term conditions for biodiversity
- Combinations with climate change adaptation strategy possible
- Compensational measures agriculture within catchment areas needed for improving environmental conditions
- Good national protection of nature needed, when not internationally protected (Utrechtse Heuvelrug)

3. Compact urbanisation

Problems:

- Infrastructure and urbanization not optimally attuned
- Accessibility of cities, congestion main road network
- Pace of intensification and restructuring

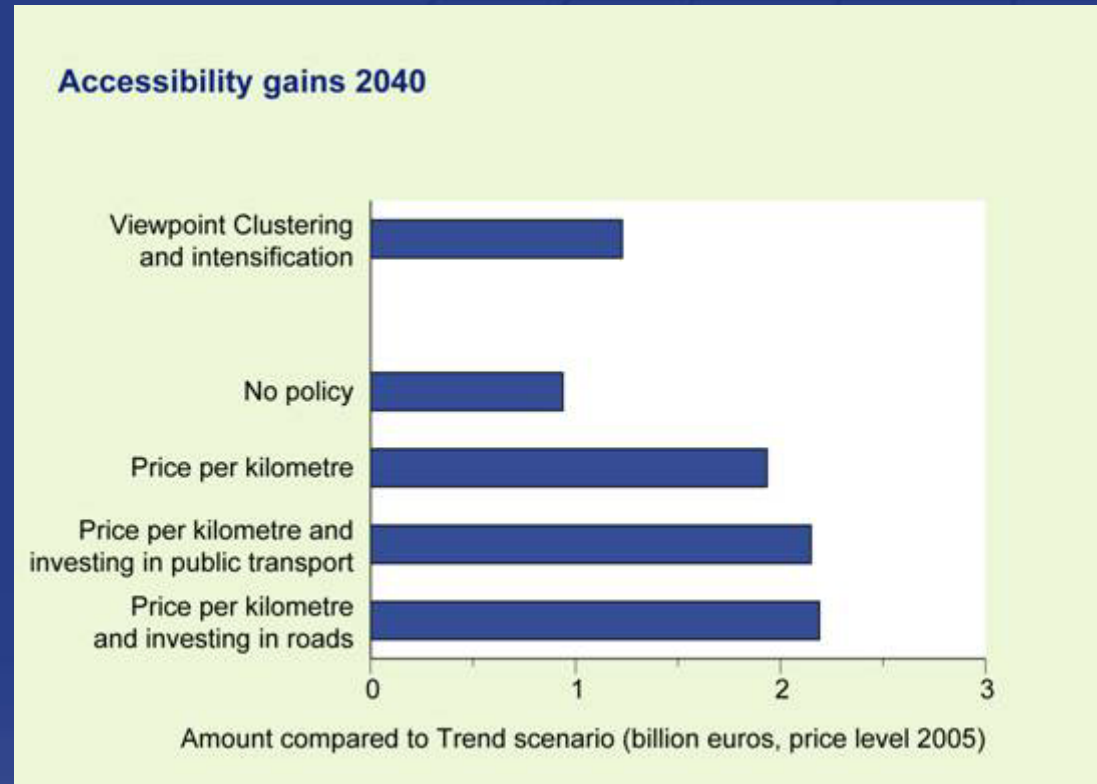

Solutions:

- 50% intensification and remainder in clustered areas near railway stations

Accessibility gains of compact urbanisation

- Accessibility gains highest due to roadpricing (differentiated to place, time, environment)
- Followed by compact urbanisation. Benefits (with modest development of mobility) higher than additional packet Mobility Policy Document (14.5 billion euros)

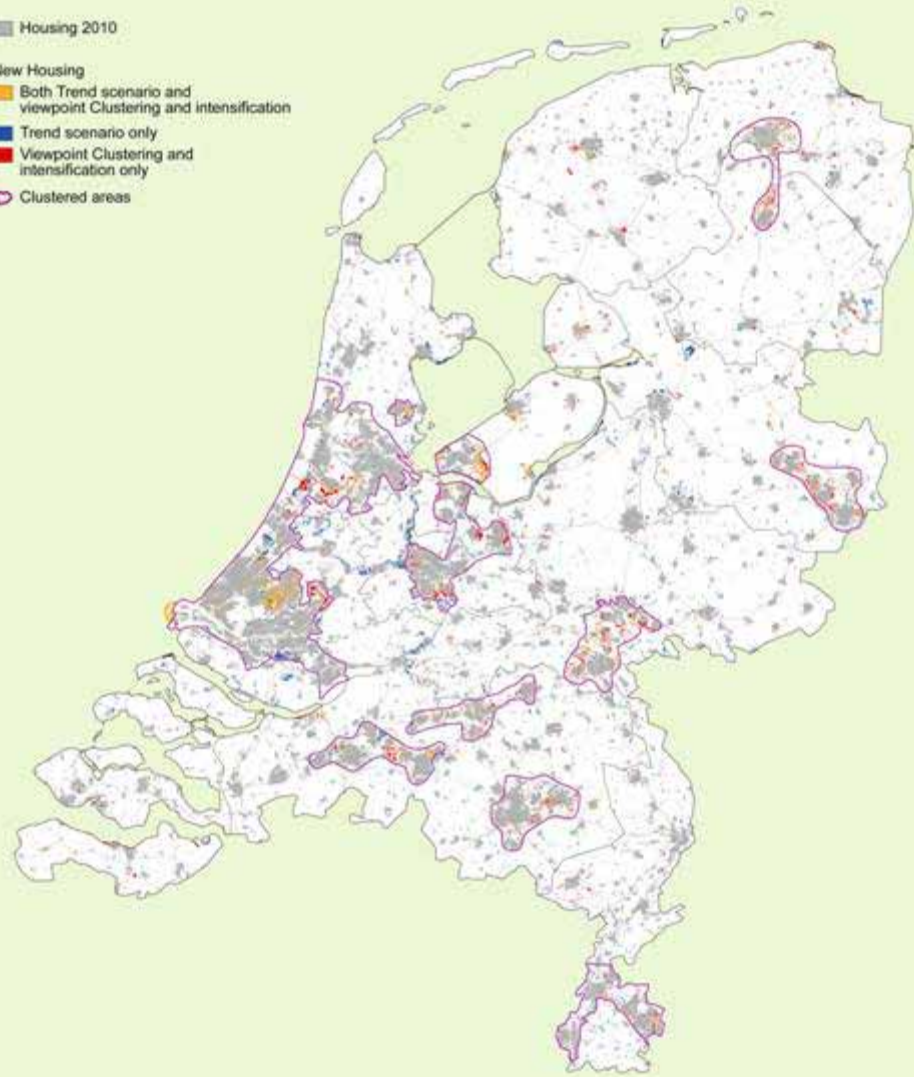

Compact urbanisation

Differences with Trend scenario

Development housing 2010-2040 according to viewpoint Clustering and intensification

- Housing 2010
- New Housing
 - Both Trend scenario and viewpoint Clustering and intensification
 - Trend scenario only
 - Viewpoint Clustering and intensification only
- Clustered areas

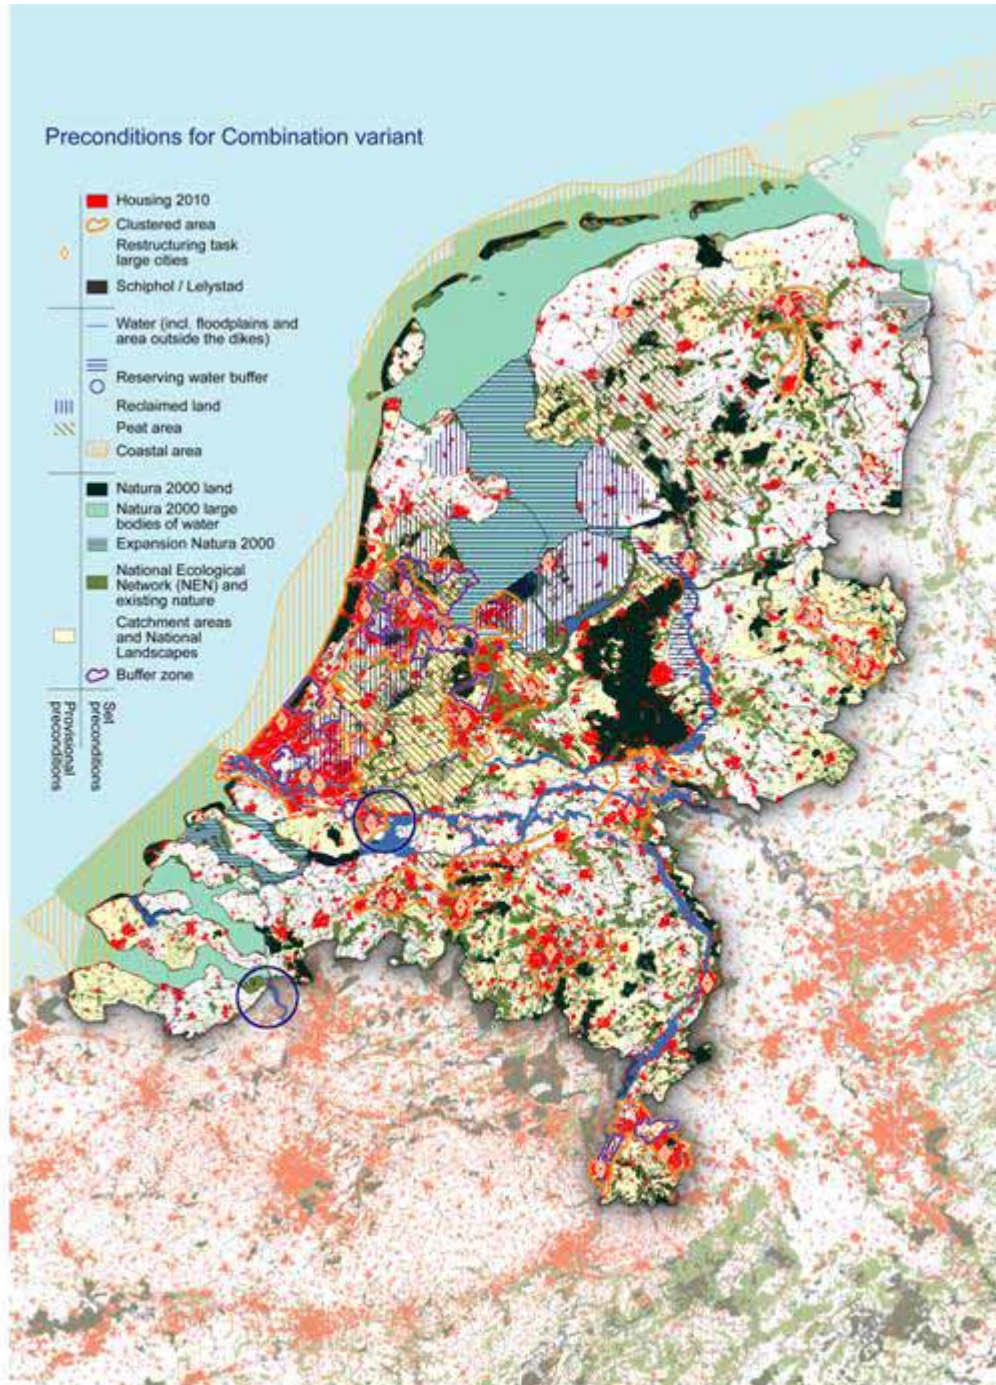

Effects mono-thematic maps versus Trend

Sustainability indicators	Explanation	Coverage Trend scenario	Effect viewpoints versus Trend scenario					
			Climate and safety	Robust Nature	Clustering and intensification	Spacious and green living	Conditions international business establishment	Landscape, tourism and recreation
Protection against flooding	Risk of damages and human casualties	Green	Green	Yellow	Yellow	Yellow	Yellow	Yellow
Adaptation to climate change	Potential areas for inundation within risk areas	Green	Green	Green	Yellow	Red	Yellow	Yellow
Biodiversity	In Natura 2000 areas	Red	Yellow	Green	Yellow	Red	Yellow	Green
Accessibility	Social financial accessibility benefits	Grey	Green	Yellow	Green	Red	Green	Yellow
Quality physical living environment	Greenery surrounding the city and noise pollution	Yellow	Yellow	Green	Red	Yellow	Green	Green
Conditions international business establishment	Congestion, perception of risks, growth in Northern Randstad areas	Grey	Yellow	Yellow	Yellow	Red	Green	Yellow
Spacious and green living	Low density housing, close to amenities and within attractive landscapes	Red	Red	Red	Red	Green	Green	Red
Quality of the landscape	Main qualities, perception and recreational values of the landscape	Red	Green	Green	Green	Red	Red	Green
Spatial segregation	Spatial distribution of the various income brackets	Grey	Yellow	Yellow	Yellow	Yellow	Green	Yellow
Management costs	Maintenance and management of public areas	Grey	Green	Green	Green	Grey	Grey	Grey
Transformation costs	Net transformation costs of changes in land use	Grey	Green	Red	Red	Grey	Grey	Grey

Sustainability:

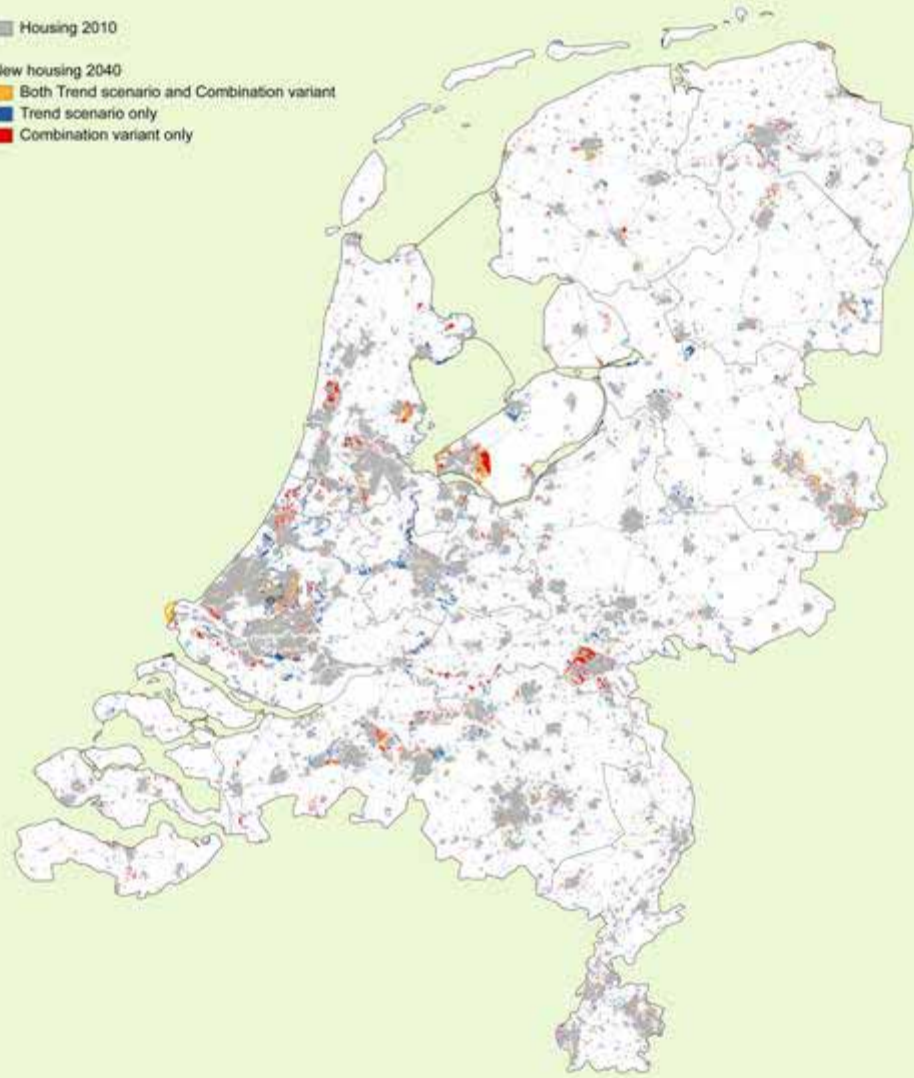

Long term cohesion in spatial developments

Integration by combining preconditions for spatial development based on the six mono-thematic outlooks

Housing development 2010-2040 in Combination variant

- Housing 2010
- New housing 2040
 - Both Trend scenario and Combination variant
 - Trend scenario only
 - Combination variant only

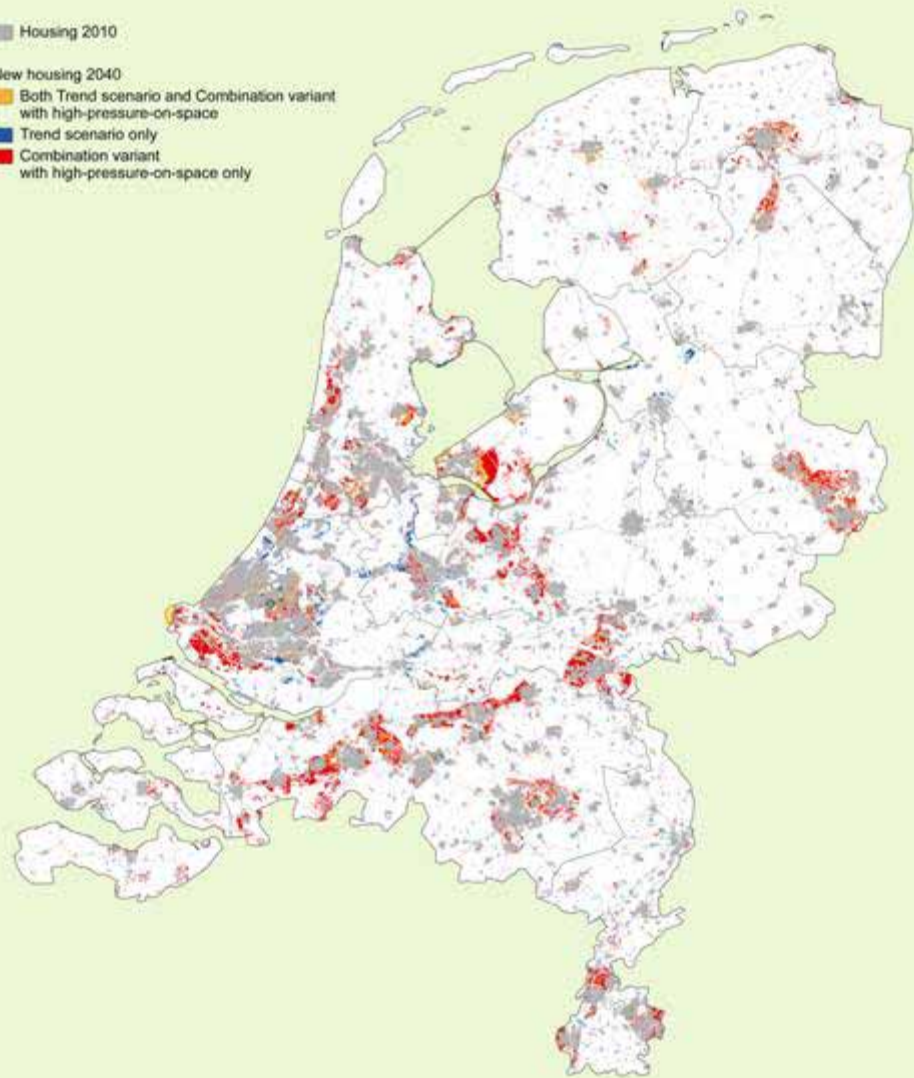

Combination map:

differences with Trend scenario
as to urban development

Housing development 2010-2040 in Combination variant with high-pressure-on-space

- Housing 2010
- New housing 2040
 - Both Trend scenario and Combination variant with high-pressure-on-space
 - Trend scenario only
 - Combination variant with high-pressure-on-space only

Combination map with high spatial pressure:

differences with Trend scenario as to urban development

Conclusions

- Compact urbanisation offers long term opportunities for nature, landscape and climate adaptation,
- Completely new policies not needed, but much more cohesion between sectoral policies is required and a long term spatial framework for consistent choices
- Consistency and cohesion will require steering on various spatial levels :
 - for taking into account the long-term spatial consequences of rising sea levels and river discharges,
 - for spatial choices on land use and transformation of urban land (housing, businesses and greenhouses),
 - for spatial choices enabling sustainable conservation of internationally important nature,
 - for the protection of the national landscapes.
